Subject: **Supplemental Groundwater Investigation Work Plan Addendum
Former J.H. Baxter Arlington Facility
Docket No. RCRA-10-2001-0086**

FILE COPY

Introduction

The former J.H. Baxter & Co., Inc. (Baxter) Arlington, Washington wood treating facility (the facility) is located at 6520 188th Street NE in Arlington, Washington (Figure 1). The facility is currently operated by Stella-Jones Corporation, and uses pentachlorophenol (PCP) as the primary wood treatment chemical. Numerous investigations and remedial activities have been completed at the facility since the 1990s.

Groundwater monitoring data collected in 2008 and 2009 as part of the Remedial Action Pilot Test has indicated a narrow pentachlorophenol (PCP) plume that extends beyond the facility boundary. In addition, groundwater elevation data from wells installed as part of the Pilot Test indicate that the groundwater flow is more northerly than previously estimated, and the farthest downgradient and offsite well (MW-18) may not be in the PCP plume flowpath (Figure 2).

In late December 2009, Baxter conducted the initial phase of the Supplemental Groundwater Investigation to further assess the extent of the PCP plume northwest of the Main Treating Area. This investigation was conducted in accordance with the *Revised Supplemental Groundwater Investigation Work Plan* that was submitted to EPA on June 5, 2009, and approved by EPA on August 13, 2009. Nine boreholes were completed at locations shown in Figure 3, and four grab groundwater samples were collected from different depth intervals and analyzed for pentachlorophenol (PCP). Concentrations of detected PCP in the grab groundwater samples are shown on the cross sections in Figures 4 and 5, and in plan view on Figure 6. A description of the field activities, laboratory results, and borehole logs are presented in Appendix A.

Results of the initial phase of the investigation indicated that the PCP plume trends towards the farthest downgradient well MW-18, but the area of highest PCP concentrations are present at depths between 70-80 feet deep, which is just beneath the depth of most of the existing monitoring wells in that area (see Appendix A). Based on the results from the December 2009 investigation, Baxter proposes additional boreholes and monitoring wells in the immediate area.

The following discussion summarizes a scope of work (SOW) for additional investigations at the facility to further characterize the PCP plume. The proposed SOW will be conducted in

accordance with the Environmental Protection Agency (EPA)-approved *Site Investigation (SI) Work Plan*, and previously approved *Supplemental Groundwater Investigation Work Plan*.

Scope of Work

The original *Supplemental Groundwater Investigation Work Plan* called for an investigation in two phases: 1) installation of exploratory boreholes using hollow stem auger methods to assess the geometry of the plume, and collection of four grab groundwater samples from each boring; and 2) installation of approximately three new groundwater monitoring wells that bisect the water table. This Addendum proposes an additional seven boreholes to verify the depth of the PCP plume, and seven additional groundwater monitoring wells.

Exploratory Boreholes

In order to evaluate the horizontal and vertical extent of the dissolved phase plume offsite and to appropriately locate groundwater wells for further plume monitoring, seven additional soil borings will be installed in or near the Northwest Parcel (Figure 7). The rationale for the specific location of each borehole is provided below:

- The boreholes located near BXS-1, L-3, and MW-30 (Figure 7) are designed to assess the depth and concentration of PCP at the lateral margins of the existing PCP plume.
- The borehole located between SB-68 and SB-72 (Figure 7) is designed to evaluate whether or not PCP is potentially migrating westerly.
- Two additional boreholes are located north of 188th Street NE (Figure 7) to assess the downgradient extent of the PCP plume.

The northernmost proposed boring locations are located on property not owned by Baxter, and will require an access agreement. If Baxter cannot obtain an access agreement from the current property owner, Baxter will request assistance from EPA in obtaining access to the property. The remaining boreholes will be located on the City of Arlington right-of-way.

Borings will be installed using hollow-stem auger equipment. Soil samples will be collected at five-foot intervals for lithologic logging purposes and field screening (sheen testing). Each boring will be advanced to approximately 100 feet below the ground surface.

During advancement of the boreholes, screening-level groundwater samples will be collected using HydroPunch groundwater sampling equipment at the 60, 70, 80, 90, and 100 foot depth intervals. Due to the anticipated turbidity, analysis of these samples is expected only to provide qualitative data regarding the general geometry of the dissolved-phase groundwater plume.

Each screening-level grab groundwater sample will be collected from the boring by advancing a HydroPunch sampler inside the auger into undisturbed soil to the appropriate depth interval. Following advancement, the protective sleeve will be retracted to expose the well screen and allow groundwater to enter the HydroPunch sampler. Following sufficient time for groundwater to enter the sampler, a bailer will be used to extract water for placement into clean, laboratory-provided sample containers. The filled sample containers will be labeled with a unique identification number, placed in a cooler with ice, and transported to the laboratory under chain of custody.

Screening-level groundwater samples will be analyzed for PCP by EPA Method 8151M or EPA Method 8270D, with 24-hour turnaround. Based on preliminary results, the number of boreholes may be reduced or increased, as appropriate, to delineate the horizontal extent of the plume.

After completion of the soil borings and groundwater sampling, each borehole will be backfilled to grade with bentonite pellets or grout and patched to match the existing surface.

The actual locations of the boreholes may be modified in the field based on laboratory results (i.e., from newly generated laboratory results generated during the investigation), access agreements, or subsurface or overhead utilities.

Monitoring Well Installation

Based on the results of the groundwater sampling, seven new groundwater monitoring wells will be installed to provide additional downgradient groundwater sampling stations (Figure 7). Four of the new monitoring wells will be placed near existing monitoring wells near the center of the existing plume (proposed wells near MW-15, MW-18, MW-34, MW-37) to provide additional information deeper in the water-bearing zone at those key locations. One proposed well is located away from the centerline of the plume (proposed well near MW-17) to assess the lateral extent of the plume, and two additional wells are located farther downgradient (proposed monitoring well near SB-74, and proposed well northwest of MW-18). Final locations may be modified in the field based on laboratory results (i.e., from newly generated laboratory results generated during the investigation), access agreements, or subsurface/overhead utilities.

The new monitoring wells will be installed using hollow-stem auger drilling equipment to a depth of approximately 80-feet below ground surface. Soil samples will be collected every five feet to the bottom of the boring for lithologic logging purposes. The monitoring wells will be constructed using 2-inch diameter, Schedule 40 PVC casing, with 0.020-inch slot placed between 70 and 80 feet below ground surface. Following well construction and a minimum 24-hour grout stabilization period, the wells will be developed.

Following installation, the wells will be measured for horizontal control by a Washington State licensed surveyor. Vertical elevation will be surveyed to the nearest 0.01 foot at the top of all new monitoring well casings.

Upon completion of monitoring well installation activities, all facility wells will be gauged with a water level indicator. The new wells will be sampled for PCP in accordance with the Performance Monitoring Plan (PMP) in future quarterly monitoring events.

All field procedures will be conducted in accordance with procedures outlined in the Appendix B (Sampling and Analysis and Data Management Plan) of the SI Work Plan, dated May 15, 2002.

Decontamination Procedures

The drilling and sampling will be cleaned before and between boreholes using tap water containing a non-phosphate detergent (e.g., Liquinox), followed by a tap water rinse, and lastly, distilled water. All decontamination fluids and purge water will be collected into a 55-gallon drum, and transferred to the onsite treatment system. Drill cuttings from the hollow-stem auger equipment will be placed into a 55-gallon drums, properly labeled and stored onsite, pending laboratory analysis and proper disposal.

Schedule

Baxter plans to conduct the scope of work outlined in this Supplemental Groundwater Investigation Work Plan Addendum within 30 days of receipt of approval from EPA, pending obtaining access agreements with offsite landowners and the City of Arlington. Results of the field activities will be submitted to EPA in the monthly progress reports and in quarterly O&M reports, and further documented in the final Corrective Measures Study.

Technical Memorandum:

Supplemental Groundwater Investigation

Technical Memorandum
J.H. Baxter and Co. Arlington Facility
Revised Supplemental Groundwater Investigation
April 30, 2010

This technical memorandum has been prepared to provide the analytical results and borehole logs for the Revised Supplemental Groundwater Investigation conducted at J.H. Baxter's Arlington, Washington facility (Figure 1). This investigation was conducted in accordance with the *Revised Supplemental Groundwater Investigation Work Plan* that was submitted to EPA on June 5, 2009, and approved by EPA on August 13, 2009. Fieldwork was conducted in December 2009, and is described in more detail below.

The investigation involved the collection of soil samples for lithologic classification and grab groundwater samples from nine boreholes (SB-66 to SB-74) located northwest of the Main Treating Area (Figure 2). The boreholes ranged in depth from 75 to 85 feet below ground surface (bgs). Four discrete grab groundwater samples were collected from each borehole approximately 10 feet (ft) apart over a 1-ft interval using a HydroPunch™ from each soil boring and analyzed for pentachlorophenol (PCP). Cascade Drilling Inc. of Woodinville, Washington conducted the drilling, and ALS Laboratories of Everett Washington conducted the laboratory analysis. Premier Environmental Services of Portland, Oregon provided drilling oversight and prepared the lithological logs. All field activities were completed between December 14 and December 23, 2009.

Deviations from the Work Plan approved by EPA included the increase in total depth for three of the nine boreholes (SB-70, SB-71, and SB-73) to account for preliminary analytical data that indicated that PCP concentrations were deeper than originally anticipated. In addition, a tenth borehole originally planned was not completed because of time constraints and scheduling issues.

Supplemental Groundwater Investigation – December 2009

Soil Borings SB-66 through SB-74

During this supplemental groundwater investigation, nine soil borings were installed northwest of the Main Treating Area using 6.25-inch diameter hollow-stem augers to depths ranging from 75 to 85 ft bgs

(Figures 2 and 3). Continuous soil samples were collected at each location using 1.5 ft-long, 2-inch diameter split spoon samplers. The hollow-stem augers were advanced using a CME hollow-stem auger drill rig operated by Cascade Drilling of Woodinville, WA. The drill rig also was used to collect the split-spoon samples using a 150-lb hammer with a 40-inch drop (blow counts were recorded for each 0.5 ft interval and are recorded on the attached soil boring logs SB-66 to SB-74).

Based on the borehole logs, the area is underlain by sand and gravel. A discontinuous silt to silty sand layer is present at depths between approximately 40 and 60 feet bgs. The silty layer was not present to the north in boreholes SB-73 and SB-74. Cross sections are presented in Figures 4 and 5. Borehole logs are presented in Attachment 1.

The groundwater samples were collected with a HydroPunch™, advanced approximately 1.0 ft with the drill rig in the selected sampling zone below the groundwater table then gently pulled back to open the disposable stainless steel screen interval. The HydroPunch™ was left open at the selected sampling interval until at least 75-100 percent full, then removed to fill the laboratory-supplied sampling containers (1-liter amber bottles). Four zones were selected in each boring, approximately 10 ft apart and starting with the first sampling interval just below the water table, ranging from 45 to 56 ft bgs, to the collection of the fourth discrete groundwater sample in each boring at depths ranging from 75 to 86 ft bgs. All groundwater samples were analyzed for PCP by EPA Method 8270. At a few select locations, two HydroPunch™ samples were collected to fill quality assurance/quality (QA/QC) control samples

Analytical results for groundwater samples are presented in Table A-1. Detected PCP concentrations in the shallow groundwater are shown on Figures 4, 5 and 6. PCP was detected in groundwater collected from each of the nine soil borings at concentrations ranging from 2 to 850 micrograms per liter (µg/L). Laboratory reports are provided in Attachment 3.

Quality Assurance/Quality Control Procedures and Sampling

The sampling equipment and supplies were decontaminated in accordance with the protocols described in the 2002 *Site Investigation Work Plan*. At each boring, the sampling equipment was decontaminated between sampling intervals with a soapy water wash, tap water rinse, and then a final de-ionized water rinse (laboratory grade, supplied by ALS laboratory). A new disposable stainless steel screen, rubber band, and new carbon steel tip was used in the HydroPunch™ at each sample interval. Sampling personnel collected groundwater samples with new disposable latex gloves at each interval. Groundwater collected from each interval was immediately poured into the laboratory supplied 1-liter amber bottle and placed in a cooler with ice. The samples were appropriately packed for shipment and a chain-of-custody (COC) form completed and signed by the ALS lab courier who picked up the samples

each evening for delivery to their laboratory in Everett, WA. Between each soil boring location, the hollow-stem augers, drill rods and HydroPunch™ was decontaminated using a hot water pressure washer.

Two blind duplicate and two rinsate samples were collected during the supplemental groundwater investigation. The blind duplicate samples were collected by pouring the groundwater collected in HydroPunch™ equally between the regular sample and QA/QC sample. The equipment rinsate samples were collected on the decontaminated HydroPunch™ by pouring de-ionized water into the sampling container and then into the 1-liter amber bottle. The analytical results are presented on Table A-1.

Quality Assurance Review

QA/QC review and data validation were conducted to confirm that all collected data complied with analytical methods and control limits as defined in the *Sampling and Analysis and Data Management Plan* (SADMP; Appendix B of the *Remedial Investigation Work Plan*). Guidance for the data validation was obtained from QA/R-5, *EPA Requirements for Quality Assurance Project Plans* and QA/G-5, *EPA Guidance for Quality Assurance Project Plans*. Quality assurance review of the organic and conventional data was performed using QA/G-8, *EPA Guidance on Environmental Data Verification and Data Validation* and EPA's functional guidelines in the context of data quality objectives specified in the SADMP. A data validation reports was prepared to document QA/QC procedures and results and can be found as Attachment 2.

MEMORANDUM

Date: January 13, 2010
To: J. Stephen Barnett, Premier Environmental Services, Inc.
From: Kathy J. Gunderson, Senior Quality Assurance Chemist
Subject: Review of Screening Data from Groundwater Samples Collected
December 2009
Project: Supplemental Remedial Investigation, J. H. Baxter Arlington,
Washington

1.0 Introduction

This memorandum presents the cursory validation of the analytical data used for screening groundwater samples collected for the Supplemental Remedial Investigation at the J. H. Baxter Arlington, Washington facility. Thirty-six groundwater samples, two field duplicates, and two field blanks were collected between December 14th and 23rd, 2009. The analyses were performed by ALS Laboratory Group, located in Everett, Washington. The samples were analyzed for pentachlorophenol by the method listed in Table 1.

The criteria used to qualify data are from the *Sampling and Analysis and Data Management Plan for the Site Investigation Work Plan J. H. Baxter Arlington Facility* (SADMP) (Baxter 2002), the *Contract Laboratory Program National Functional Guidelines for Organic Data Review* (USEPA 1999), the analytical method, or the professional judgment of the validation chemist. The following laboratory deliverables were reviewed during the validation process:

- Chain-of-custody (COC) documentation to assess holding times and verify report completeness
- Laboratory quality control (QC) sample results, including method blanks, surrogate spikes, laboratory control sample/laboratory control sample duplicates (LCS/LCSDs)
- Analytical results to verify reporting limits
- Field QC samples to assess field duplicate precision and field blank contamination

Review of Screening Data from Groundwater Samples Collected December 2009
Supplemental Remedial Investigation, J. H. Baxter Arlington, Washington
January 13, 2010

Field duplicate precision is presented in Table 2 and the qualified data are summarized in Table 3 at the end of this memorandum. Data qualifier flags have been added to the hardcopy laboratory report used for validation and the project database.

Table 1—Sample Data Reviewed

^a Feet below ground surface

^b Pentachlorophenol by Method 3510/8270 (USEPA 1996) Selective ion monitoring (SIM)

2.0 Data Validation Findings

2.1 Custody, Preservation, and Completeness – Acceptable

Sample custody was maintained as required from sample collection to receipt at the laboratory. The samples were received intact and were properly preserved. The laboratory reports are complete and contain results for all samples and tests requested on the COC forms.

- Pentachlorophenol was not reported in the LCS/LCSD analyses of laboratory reports 0912132, 0912137, 0912148, and 0912150. The laboratory resubmitted complete reports electronically.

2.2 Pentachlorophenol Analyses

2.2.1 Holding Times – Acceptable

The samples were extracted within the required holding time of seven days from collection and analyzed within the required holding time of 40 days from extraction.

2.2.2 Blank Analyses – Acceptable with Qualification

2.2.2.1 Method Blanks

Method blanks were analyzed at the required frequency of one per extraction batch. Pentachlorophenol was not detected in the method blanks.

2.2.2.2 Field Blanks

Two equipment rinsate blanks, sample Rinsate/EB-1 and GW-73-5, were collected with the samples. Pentachlorophenol was detected in one of the rinsate blanks as discussed below.

- Pentachlorophenol was detected in the rinsate blank Rinsate/EB-1 at 1.9 µg/L. Functional Guidelines prescribes three qualifications schemes for blank contamination: (1) associated sample concentrations greater than the action level (five times the blank concentration) are not qualified, (2) associated sample concentrations less than the action level and greater than the reporting limit are qualified as undetected (U) at the reported value, and (3) associated sample concentrations less than the action level and less than the reporting limit are qualified as undetected (U) at the reporting limit. The associated samples were qualified as shown below.

Sample ID	Analyte	Qualifier	Quality Control Exceedance
GW-66-2	Pentachlorophenol	U at reported value	Result > RL & < 5 times the field blank level

2.2.3 Surrogate Analyses – Acceptable with Discussion

Except as noted below, surrogate compounds were reported for all samples, blanks, and QC samples. The recovery values are within the laboratory control limits.

- Surrogate recovery values were not reported for the QC samples (method blanks, LCSs or LCSDs). Data qualifiers are not required.

2.2.4 Matrix Spike/Matrix Spike Duplicate Analyses

MS/MSDs were not analyzed with the samples due to the screening nature of the analyses.

2.2.5 Laboratory Control Sample Analyses – Acceptable

LCS/LCSDs were analyzed at the required frequency of one per extraction batch. The recovery values are within the laboratory control limits.

2.2.6 Laboratory Reporting Limits – Acceptable

The reporting limit goal of 0.50 µg/L for pentachlorophenol was met for samples that were analyzed undiluted.

2.2.7 Field Duplicates – Acceptable

Two field duplicates were collected with the samples. The SADMP criterion for field duplicate precision of water samples is RPD values less than or equal to 35. Field duplicate precision is acceptable as shown by the low RPD values listed in Table 2.

2.2.8 Overall Assessment of Data Useability

The usability of the data is based on the EPA guidance documents noted previously. Upon consideration of the information presented here; the data are acceptable. The data qualifier flags modify the usefulness of the individual values.

3.0 Data Qualifier Definitions

The following data validation qualifiers were used in the review of the organic analyses in this data set. These qualifiers are from the *Contract Laboratory Program National Functional Guidelines for Organic Data Review*.

- U The analyte was analyzed for but not detected above the reported sample quantitation limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification".
- NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the samples and meet quality control criteria. The presence or absence of the analyte cannot be verified.
